-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
Phe-FRNA synthetase alpha chain subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              32; Gaps

Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).
-! SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).
-! SUBCELGIAR LOCATION: Cytoplasmic (By similarity).
-! SUBCELGIAR EDGATION: Cytoplasmic (By similarity).

Appl. Microbiol. 43:355-361(1997).

- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of x subunits (By similarity).

- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                73 MRNIEARGLKOMKROGDANVKGEEGIVKAHLLIGVHDD---IVSMEYDLAY-----

Bacterial. 184:4601-4611(2002).

FUNCTION: Prevents misfolding and promotes the refolding a proper assembly of unfolded polypeptides generated under conditions (By similarity).

SUBUNIT: Oligomer of 14 subunits composed of two stacked 17 subunits (By similarity).

SUBCELULIAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the chaperonin (HSP60) family.

-1- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).

-1- SUBCLULAR LOCATION: Cytoplasmic (By similarity).

-1- SUBCLULAR LOCATION: Cytoplasmic (By similarity).

-1- SUBCLULAR Belongs to the chaperonin (HSP60) family.

Probable M18-family aminopeptidase 1 (EC 3.4.11.-).
APEA OR CAC1091.
Clostridium acetobutylicum.
Bacteria; Firmicutes; Clostridia; Clostridiales; Clostridiaceae;
                                                                                                                                                                                                               Science 273:1058-1073(1996).
-!-SIMILARITY: Belongs to the S4E family of ribosomal proteins.
-!-SIMILARITY: Contains 1 S4 RNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 1; Length 244;

-I-CATALYTIC ACTIVITY: IMP + H(2)0 = 5-formamido-1-(5-phosphoribosyl)imidazole-4-carboxamide.

-I-PATHWAY: De novo purine biosynthesis; ninth step.

-I-PATHWAY: De novo purine biosynthesis; tenth step.

-I-PATHWAY: De novo purine biosynthesis; tenth step.

-I-DOMAIN: The IMP cyclohydrolase activity resides in the N-terminal region (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HAWAP, WF 00139, -; 1.

SUBUNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII' complex. PolIII' associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the bete chain to form the complete DNA polymerase III complex (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the DNA polymerase type-C family. DnaE

60 kDa chaperonin (Protein Cpn60) (groEL protein) (Fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7 subunits (By similarity).
--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
--- SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                  Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    56655 MW; 9E118C11ABC2430A CRC64;

Gen. Appl. Microbiol. 43:355-361(1997).

-!- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-!- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of abbunits (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN-JCM 1241;

-! PUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-! SUBDNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).

-! SUBCELUTAR LOCATION: Cytoplasmic (By similarity).

-! SUBCELUTAR LOCATION: Cytoplasmic (HSP60) family.

"Identification of a second human acetyl-CoA carboxylase gene.";
Biochem. J. 316:915-922(1996).
-!- FUNCTION: ACC-beta may be involved in the provision of malonyl-CoA or in the regulation of fatty acid oxidation, rather than fatty acid biosynthesis. This protein carries three functions: biotin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    carboxyl carrier protein, biotin carboxylase, and carboxyl transferase.

CATALYTIC ACTIVITY: ATP + acetyl-CoA + HCO(3)(-) = ADP + phosphate + malonyl-CoA.
                                                                                                                                                                13 VAVSADPIHYDKITEEINKAIDDAI-AAIEQSETIDPMKVPDHADKFERHVGIVDFKGEL

-!- FUNCTION: THE BRANCHED-CHAIN ALPHA-KETO DEHYDROGENASE COMPLEX CAPALYZES THE OVERALL, CONVERSION OF ALPHA-KETO ACIDS TO ACYL-COA AND CO(2). IT CONTAINS MULTIPLE COPIES OF 3 ENZYMATIC COMPONENTS: BRANCHED-CHAIN ALPHA-KETO ACID DECARBOXYLASE (E1), LIPOAMIDE ACYLTRANSFERASE (E2) AND LIPOAMIDE DEHYDROGENASE (E1), LIPOAMIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   STRAIN=AR39;

"Genome sequences of Chlamydia trachomatis MoPn and Chlamydia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: Dihydrolipoamide + NAD(+) = lipoamide + NADH.
COFACTOR: Binds 1 FAD per subunit (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
MISCELLANBOUS: The active site is a redox-active disulfide bond.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Genomic sequence comparison of two unrelated isolates of Chlamydia pneumoniae from Japan and U.S."; Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.

"The complete genome sequence of Haemophilus ducreyi.";
submitted (UNT-2003) to the EMBL/Genbank/DbbM databases.
-!- FUNCTION: Prevents misfolding and promotes the refolding and
proper assembly of unfolded polypeptides generated under stress
conditions (By similarity).
-!- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of
7 subunits (By similarity).
                                                                                                                                                                                                                                                                                                                                                           13 VAVSADPIHYDKITEEINKAIDDA-IAAIEQSETIDPMKVPDHADKFERHVGIVDFKGEL

-!- CATALYMIC ACTIVITY: ATP + H(2)O = ADP + phosphate.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the cation transport Arpases family (P-type ATPASSS). Subfamily IB.
-!- SIMILARITY: Contains I HMA domain.

V-type ATP synthase subunit E (EC 3.6.3.14) (V-type ATPase subunit E)
                                                                                                                                                                                                                                                                                                                                          "Complete genomes sequence of an aerobic thermoacidophilic Crenarchaeon, Sulfolobus tokodaii strain7.";

PLANCATION: SI123-140(2001).

PLANCATION: Produces APP from ADP in the presence of a proton gradient across the membrane.

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

-!- SIMILARITY: Belongs to the V-ATPase E subunit family.
                                                                                                                Archaea; Crenarchaeota; Thermoprotei; Sulfolobales; Sulfolobaceae;

SUBUNIT: Oligomer of 24 identical subunits (By similarity).
SUBUNIT: Oligomer of 24 identical subunits (By similarity).
MISCELLANBOUS: The di-iron binding site functions as active sit where iron lons are oxidized from iron(II) to iron(III) before they are stored (By similarity).
SIMILARITY: Belongs to the bacterioferritin family.
SIMILARITY: Contains 1 ferritin-like diiron domain.

"Phylogenetical relationship based on groE genes among phenotypically related Enterobacter, Pantoea, Klebsiella, Serratia, and Erwinia
                                                                                                                                                                                                                                                                                                                 J. Gen. Appl. Microbiol. 43:355-361(1997).

-!- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-!- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of rubunits (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplemic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.

Gen. Appl. Microbiol. 43.355-361(1997).

-!- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-!- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of rubunits (By similarity).

-!- SUBCELULAR LOCATION: Cytoplesmic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.

-!- FUNCTION: Prevents misfolding and promotes the refolding and promotes assembly of unfolded polypeptides generated under stress conditions (By similarity).

-!- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of rubunits (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.

-1- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-1- SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).

-1- SUBCELIULAR LOCATION: Oytoplasmic (By similarity).

-1- SUBCELIULAR LOCATION: Oytoplasmic (By similarity).

Gen. Appl. Microbiol. 43:355-361(1997).

FUNCTION: Prevents misfolding and promotes the refolding of proper assembly of unfolded polypeptides generated under sconditions (By similarity).

SUBUNIT: Oligomer of 14 subunits composed of two stacked 37 subunits (By similarity).

SUBCELULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SCA4 OR D.

FREPS in solution.",

"Three-dimensional structure of the immunophilin-like domain of

FREPS in solution.",

I- FUNCTION: Component of unactivated mammalian steroid receptor

complexes that sediment at 8-10 8. May have a rotamase activity.

May play a role in the intracellular trafficking of hetero-
oligomeric forms of steroid hormone receptors

oligomeric forms of steroid hormone receptors

-:- CATALYTIC ACTIVITY: Peptidylproline (omega=180) = peptidylproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBGINIT: Associates with HSP90 and HSP70 in unactivated steroid hormone receptor complexes. Also interacts with peroxisomal phytanoyl-CoA alpha-hydroxylase (PHYH) (By similarity). Interacts with NR3C1 and dynein.

SUBCELULAR LOCATION: Nuclear and cytoplasmic.

PIM: Phosphorylation by CK2 results in loss of HSP90 binding

SIMILARITY: Belongs to the FKBP-type PPIase family.
SIMILARITY: Contains 2 FKBP-type PPIase domains.
SIMILARITY: Contains 3 TPR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FKBP-TYPE 1.

J. Bacteriol. 185:2330-2337(2003).

-!- FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).

-!- SIBNINI: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SPECIES-S.typhi; STRAIN-CT18; MEDLINE-21534947; PubMed=11677608; Parkhill J., Dougan G., James K.D., Thomson N.R., Pickard D., Wain J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COMPLEX WHICH ASSOCIATES WITH THE CYTOPLASMIC DOWAIN OF A VARIETY OF CADHERINS. THE ASSOCIATION OF CATENINS TO CADHERINS PRODUCES A COMPLEX WHICH IS LINKED TO THE ACTIN FILAMENT NETWORK, AND WHICH SEEMS TO BE OF PRIMARY IMPORTANCE FOR CADHERINS CELL-ADHESION PROPERTIES, ALPHA N-CATENIN IS CRUCIAL NOT ONLY FOR CADHERINS. FUNCTION BUT ALSO FOR REGARIZATION OF MULTICELLULAR STRUCTURES.
-!- TISSUE SPECIFICITY: MAINLY IN THE NERVOUS SYSTEM.
-!- SIMILARITY: STRONG, TO VINCULINS AND TO OTHER ALPHA-CATENINS.

Proc. Natl. Acad. Sci. U.S.A. 100:1316-1321(2003).
-!- FUNCTION: Regulates arginine biosynthesis genes (By similarity).
-!- PATHWAY: Arginine biosynthesis; regulation.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the argR family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Brueggemann H., Baeumer S., Fricke W.F., Wiezer A., Liesegang H., Decker I., Herzberg C., Martinez-Arias R., Merkl R., Henne A., Gottschalk G.;

1-19th-induced protein, chloroplast precursor (Chloroplastic drought-induced stress protein CDSP-34).
Solamum tuberosum (Potato).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CHECKLULAR LOCATION: Chloroplast thylakoid membrane.
SUBCELULLAR LOCATION: Expressed in leaves.
INDUCTION: By high illumination, water stress and abscisic acid.
SIMILARITY: BELONGS TO THE LIPC FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pruvot G. Cuine S., Peltier G., Rey P.;
"Characterization of a novel drought-induced 34-kDa protein located in the thylakoids of Solanum tuberosum L. plants.";
Planta 198:471-479(1996).
-!- FUNCTION: Required for normal plant growth. May be both photogrotective and play an ancillary role in photosynthesis. Me structurally stabilize thylakoids during osmotic and oxidative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gillet B., Beyly A., Peltier G., Rey P., "Molecular characterization of CDSP 34, a chloroplastic protein induced by water deficit in Solanum tuberosum L. plants, and regulation of CDSP 34 expression by ABA and high illumination."; Plant J. 16:257-262(1998).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         U. Bacteriol. 184:2005-2018(2002).
-!- CATALWYNIC ACTIVITY: ATP + L-alanine + tRNA(Ala) = AMP +
CATALWIC ACTIVITY: ATP + L-alanyl-tRNA(Ala).
-! Gibhosphate + L-alanyl-tRNA(Ala).
-!- SUBCELBULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-FEB-2003 (Rel. 41, Last sequence update)

A complete genome sequence of Methanbacterium thermoautotrophicum
deltair functional analysis and comparative genomics.";
A Bacteriol. 197-7135-7155 (1997).
- I- FUNCTION: Catalyzes the condensation of the acetyl group of
a cetyl-CoA with 3-methyl-2-oxobutanoate (2-oxoisovalerate) to form
3-carboxy-3-hydroxy-4-methylpentanoate (2-isopropylmalate).
- CATALYTIC ACTIVITY: Acetyl-CoA + 3-methyl-2-oxobutanoate + H(2) 0 =
- CATALYTIC ACTIVITY: Acetyl-CoA + 3-methyl-2-oxobutanoate + H(2) 0 =
- CHMIANITY: Belongs to the alpha-IPM synthetase / homocitrate
Synthase family. LeuA | subfamily.
